

PRODUCT OVERVIEW

The Cheetah GPSmirror is a **driver safety system** that warns you with voice alerts when you are approaching accident blackspots, speed cameras and red light camera intersections.

The GPSmirror only warns of locations that are stored in its memory so it doesn't give false alarms like a radar detector. It comes pre-loaded with USA camera locations from the Trinity Database and you can mark your own locations for personal reminders. You update it once a month by connecting it to your PC and downloading new camera locations from Cheetah's website. There are no subscription charges.

Use it either as a stand-alone GPS detector or as the central warning device for any of the high-end radar detectors and laser systems. The GPSmirror is the first and only GPS camera detector in the world with **Wireless Datalink Technology** that enables it to relay alerts from standard radar detectors and laser jammers. It is also the first GPS detector in the world to offer **F.A.S.T. - False Alert Suppression Technology**.

This new GPS camera detector is built into an elegant mirror unit that simply clips over your car's existing rear view mirror, keeping your dashboard and windscreen clutter free. The wide angle mirror helps to eliminate blind spots as well as letting you keep an eye on traffic and any kids in the back seat, at the same time. The **NIGHTblue** anti-glare coating provides better night vision than most auto-dimming mirrors.

Enhanced driver safety

No matter how carefully we drive, it's very easy for anyone to have occasional lapses in concentration that could result in a fine and points or even worse, an accident. The new Cheetah GPSmirror is a hazard locator, designed to protect you, as well as your livelihood and your licence by making you more aware of your speed, your surroundings and approaching hazards.

Advance warning of dangerous intersections and accident zones

Advance warning of accident blackspots and high risk zones can help you stay focused and can greatly enhance road safety. Your GPSmirror gives out visual, spoken and audible safety alerts to notify you of approaching cameras or hazards in your direction of travel, giving you time to refocus, concentrate and plan ahead. There are 8 different GPS advisory safety warnings and 10 different camera warnings. Voice alerts identify the hazard type, and the digital display gives you a distance countdown to the hazard's location.

Covers all types of safety cameras

Your GPSmirror's memory can store up to 120,000 locations. It contains the GPS coordinates of the dangerous intersections and roads with accident histories where red-light

or speed cameras are used. It alerts you to **all types of Fixed Speed Cameras**, Red Light Cameras and Average Speed Speed Cameras (GATSO, Truvelo, SPECS, Traffiphot, Redspeed, Redflex, ACS, ATS, Nestor, etc) as well as other known accident blackspots and common mobile speed trap sites. The warnings for common mobile sites can be turned off and you can even store your own personal warning locations.

Helps you to become more aware of your speed

The GPS speedo accurately displays your current speed from behind the mirror glass. Advisory speed limits when you are approaching a camera let you easily compare your own speed to the posted speed limit at that location. There is also a useful **Overspeed Reminder** which reminds you whenever you drive faster than your chosen setting.

Helps eliminate blind spots and improve night vision

One of the first things you notice about this product is the size. It's slightly larger than most factory mirrors, partially for cosmetic reasons to cover your original mirror, but mostly for safety reasons. It's a wide angle mirror which greatly increases your rear vision and helps to eliminate blind spots on many cars. 93% of customers prefer our specialized **NIGHTblue** anti-glare coating to their original automatic dimming mirror, reporting better night vision while not being dazzled.

Works at home or abroad and it's completely legal

The on-board Trinity database currently covers the USA, UK, Spain, France and Norway. Canada, Portugal, Scandinavia, the rest of Europe and Australia are actively being logged and will be available later in 2007. There are no ongoing costs, subscription charges or download fees. Camera updates are done through the internet and your PC using a USB and a serial port.

Easy to use and easy to swap between cars.

The spring-loaded adjustable clips make it easy to fit over 99% of factory mirrors on the market. The power cord can be hardwired or simply plugged into your car's cigar lighter socket. If you want to swap your Cheetah GPSmirror between two vehicles we recommend you purchase an extra power cord to fit in the second vehicle. This makes it easy to swap over in seconds.

"Fit and Forget" technology - hassle free

These days, leaving an auto accessory on display inside your car is often asking for trouble. Other systems normally have to be hidden from sight or removed every time you leave the vehicle to avoid attracting the attention of thieves. Cheetah's elegant design leaves your dashboard and windscreen clutter free and its discreet nature makes it almost unnoticeable from outside the vehicle, so many customers feel comfortable about leaving their mirror in place when they park.

SiRF star III

The GPSmirror uses the latest SiRF star III chipset so you know it's going to be reliable, even in tricky urban canyon conditions where other systems may falter. There is a useful driving compass display with an audio heading announcement feature. "**Rescue Me**" coordinates can be heard at the touch of a button. There's even a handy clock display option.

PRO FEATURES

Mobile Radar DATALINK

The Cheetah GPSmirror is the only GPS detector in the world which can wirelessly integrate with, and enhance, a wide range of the best radar detectors from various manufacturers.

If you want to integrate your radar detector with the GPSmirror (i.e. you want to hear radar speed trap alerts through your mirror and use the GPS settings to get rid of false alarms, etc) you need to purchase a **Cheetah Radar Detector Interface** to plug into your detector.

F.A.S.T. - False Alert Suppression Technology

Simple, but incredibly effective at cutting out those annoying false alarms in town. Detector alerts are automatically muted below your programmed Alert Speed, e.g. 35 mph.

Voice alerts and audio tones

Voice announcements tell you the band that is being detected and alert tones convey the signal strength.

Band Control

Disable unwanted radar bands if they are not used in your area.

City Mute

In city mute mode, the GPSmirror only plays voice alerts for radar alerts. The normal alert tones are disabled.

Mobile Laser DATALINK

The Cheetah GPSmirror is also the only GPS detector in the world which wirelessly integrates with all the best laser jammers on the market.

Website text for Cheetah GPS Mirror – last updated 29.06.07

If you want to integrate your laser system with the GPSmirror, you need to purchase a **Cheetah Laser Jammer Interface** to plug into your jammer.

PRODUCT SPECIFICATION

- GPS driver safety system
- Wide angle mirror glass
- NIGHTblue anti-glare
- GPS speedometer
- SiRF star III chipset
- Voice, tone & visual alerts
- All types of safety cameras
- 10 types of camera warning
- 8 types of advisory warning
- Advisory speed limits
- 120,000 location memory
- Mark up to 100 personal locations
- Trinity Database access
- No subscription charges
- Directional camera alerts
- Overspeed alerts
- Compass driving direction
- Visual time display
- Rescue Me coordinates
- Mobile Radar Datalink*
- Mobile Laser Datalink**
- F.A.S.T. – False Alert Suppression Technology*
- Radar Band Control*
- Radar City Mute function *

* requires Radar Detector Interface

** requires Laser Jammer Interface
